## Digital Retinal Screening Photos

Digital retinal photography is a technology that allows the doctor to obtain detailed images of the inside of your eye including: your optic nerves, blood vessels, and macula. These photos can detect abnormalities that may threaten normal vision.

Dr. Elgas and Dr. Carlos strongly believe that all patients should have baseline digital images taken of their retinas. This is important even for patients with healthy eyes. These baseline images allow her to monitor changes that may occur over time.

Currently, unless you have a specific medical condition such as glaucoma or diabetes and meet specific insurance requirements, these screening photos are not covered by your health insurance.

### **The fee is \$75.00**

Yes, I would like screening photos taken of my retinas

No, I prefer not to have photos taken today
